

SCIENCE

A WEEKLY RECORD OF SCIENTIFIC PROGRESS.

ILLUSTRATED.

Published at "Tribune" Building (Room 17), New York.

NEW YORK HERALD, June 29, 1880:

"SCIENCE—A Weekly Record of Scientific Progress." It is a handsome, well-printed quarto sheet of 12 pages, with 4 additional pages for advertisements serving as a cover. It counts among its list of contributors Professors Baird and Coues, of the Smithsonian Institution; Holden, of the Naval Observatory, Washington; Marsh, of Yale; Wilder, of Cornell; Young, of Princeton; Abbe, of the Signal Office; Morse, of Salem; Drs. Hammond and Spitzka, of New York, and a considerable number of well-known scientific experts. IT CLAIMS, WITH TRUTH, TO OCCUPY A HITHERTO UNOCCUPIED FIELD IN AMERICAN PERIODICAL LITERATURE, AS THE ONLY FIRST-CLASS WEEKLY JOURNAL IN THE UNITED STATES DEVOTED TO SCIENCE.

DR. SCOTT'S ELECTRIC HAIR BRUSH

IS GUARANTEED TO CURE

**NERVOUS AND BILIOUS HEADACHE IN 5 MINUTES,
NEURALGIA and TOOTHACHE in 5 MINUTES,
CURES DANDRUFF AND PREVENTS BALDNESS**

**PRICE, \$3.00. Of All Dealers, or of
GEORGE A. SCOTT, 842 BROADWAY, N. Y.**

DR. SCOTT'S ELECTRIC **FLESH** BRUSH.

EXACT SIZE.

ASTONISHING CURES!

Royalty, members of her Majesty's Government, and many professional gentlemen who have tested the power of the brush are unanimous in its praise, and its Therapeutic value cannot be disputed, having the approval of numerous medical men. Constructed upon scientific principles, the result of twelve years' study and practice, it is thoroughly and permanently charged with an "Electric" force which produces remarkable cures. It generally gives relief in five to seven minutes, and its application is most agreeable and grateful, there being no shock or unpleasant feeling attending its use. Always doing good, it cannot harm, and aside from its curative powers is a beautiful flesh brush (wet or dry), elegantly carved and lasting for years. Its power can always be tested by a silver compass which accompanies each Brush. Our Dr. Scott's Electric Hair Brush having met with the same appreciation here, which its excellent merits secured for it in England, we now introduce to the American public his Electric Flesh Brush, confident that it will soon find its way into every household.

IT CURES

**Rheumatism, Sciatica, Gout, Nervous Debility,
Lumbago, Neuralgia, Toothache, Malarial
Lameness, all Pains and Aches resulting from
Colds, Impure Blood, and Impaired Circulation.
It acts quickly in Stomach, Liver, and Kidney
Troubles, and is a valuable assistant in their
Treatment. It quickly Removes those "Back
Aches" peculiar to LADIES.**

It keeps the skin healthy, beautifies the complexion, and imparts vigor and energy to the whole body. People of sedentary habits and impaired nervous powers will find it a valuable companion.

Proprietors: The Pall Mall Electric Association
of London. New York Branch: 842 Broadway.

TESTIMONIALS.

ATWOOD'S PHARMACY, Broadway, New York, May 15, 1881.
Dr. Scott: I have sold at retail over my counter, during the last few months, over \$3,500 worth of your Electric Brushes at \$3.00 each. They give splendid satisfaction, and many have come back and bought the second, third, and fourth one. I have heard many customers praise them highly, and from my own personal knowledge, I know of most remarkable cures attending their use. I cordially recommend them to the public." HERMON W. ATWOOD.

"I prescribe it for my patients with the happiest results. Its cures are unquestionable." DR. JOHN GAVETT GIBSON, F.C.S.

"Better than all liniments and embrocations. We cannot too highly recommend it to the afflicted." SURGICAL GAZETTE.

"For some time past I have suffered from Rheumatism in my knee. I tried your Brush and the result astonished me, in less than three minutes the pain disappeared and I have not had it since. Wishing to convince myself still further, I took it to my place of business and cured two workmen of Neuralgia and a third of Toothache. I am now satisfied with the virtue of your Brush, and do not hesitate to speak a good word for it to suffering humanity."
Yours respectfully, JESSE M. HARR.

Space forbids our publishing innumerable letters of praise and gratitude from those using our Brush. Where addresses are not given they will be furnished with pleasure on application.

MENTION THIS PAPER.

As soon as you receive the Brush, if not well satisfied with your bargain, write us, and we will return the money. What can be fairer? The Proprietors of this Publication know Dr. Scott to be respectable and trustworthy.

A BEAUTIFUL BRUSH, LASTING FOR YEARS.

[We will send it on trial, postpaid, on receipt of \$3.00, which will be returned if not as represented.]

Inclose 10 cents extra and we guarantee safe delivery into your hands; or will send it by express, C. O. D., at your expense, with privilege of examination: but expressage adds considerably to your cost. Or request your nearest Druggist or Fancy Store to obtain one for you, and be sure Dr. Scott's name is on the box. Remittances should be made payable to GEO. A. SCOTT, 842 Broadway, New York. They can be made in Checks, Drafts, Post Office Orders, Currency, or Stamps. LIBERAL DISCOUNT TO THE TRADE. Agents Wanted in every town. Send for circular of Dr. Scott's Electric Hair Brush.

CAUTION.

An attempt has been made to put so-called "Electro Magnetic" Brushes upon the market, but the Post-Office authorities at Washington have published the company as a fraud. We therefore caution the Public to be careful that "Dr. Scott's" name is on the box and "Electric" on the Brush. Ours is not wire, but a pure bristle Brush.

** * I., B., T. & Co. will send Descriptive Lists and Prices of their Publications on application.*

DANA'S GEOLOGICAL STORY BRIEFLY TOLD. An introduction to Geology for the general reader and for beginners in the Science. By Prof. JAMES D. DANA, LL. D. 1 vol. 12mo, 275 pages. Numerous illustrations and handsomely bound. \$1.35.

DANA'S TEXT BOOK. Revised Edition. A Text-Book of Geology, designed for Schools and Academies. By JAMES D. DANA, LL. D., Silliman Professor of Geology and Natural History, Yale College. Cloth. Fully illustrated. 350 pages. \$1.80.

DANA'S MANUAL OF GEOLOGY. Third and Revised Edition, issued in January, 1880. Treating of the Principles of the Science, with special reference to American Geological History, for the use of Colleges, Academies and Schools of Science. By JAMES D. DANA, LL. D., Silliman Professor of Geology and Natural History, Yale College. Illustrated by a Chart of the World, and over one thousand figures, mostly from American sources. 1 vol. 8vo. 927 pages. \$4.45.

GRAY'S HOW PLANTS BEHAVE, HOW THEY MOVE, CLIMB, EMPLOY INSECTS TO WORK FOR THEM. Beautifully illustrated and printed on fine paper. 4to. 62 cents.

GRAY'S HOW PLANTS GROW. A Simple Introduction to Structural Botany, with a *Popular Flora*, or an arrangement and description of Common Plants, both wild and cultivated. Intended for young people and Common Schools. Illustrated by more than 500 engravings. 232 pages. Small quarto. 95 cents.

This book, in connection with the "School and Field Book," supplies a complete course in Botany for Common Schools, Academies, and Seminaries.

GRAY'S LESSONS IN BOTANY AND VEGETABLE PHYSIOLOGY, to which is added a copious Glossary of Dictionary of Botanical Terms. Fully illustrated. Cloth. 8vo. 236 pages. \$1.10.

GRAY'S FIELD, FOREST AND GARDEN BOTANY. A simple introduction to the Common Plants of the United States east of the Mississippi, both wild and cultivated. Cloth. 8vo. 386 pages. \$1.65.

GRAY'S SCHOOL AND FIELD BOOK OF BOTANY. Comprising the "Lessons in Botany" and "Field, Forest, and Garden Botany." A most popular and comprehensive School Book, adapted to beginners and advanced classes. 1 vol. 8vo. Cloth. 621 pages. \$2.10.

This book, in connection with "How Plants Grow," supplies a complete course in Botany for Common Schools, Academies, and Seminaries.

GRAY'S MANUAL OF BOTANY. Arranged according to the natural system, and containing 20 plates, illustrating the Sedges, Grasses, Ferns, etc. Fifth edition, 1867. Eighth issue, 1868. Cloth. 8vo. 700 pages. \$1.86.

THE SAME, bound with "The Lessons." \$2.50.

This work, in connection with "The Lessons," supplies a complete course in Botany for Colleges and Scientific Schools.

GRAY'S NEW STRUCTURAL AND SYSTEMATIC BOTANY. An Introduction to Structural and Systematic Botany and Vegetable Physiology, being the *sixth* and revised edition of the Botanical Text-book. Illustrated by numerous woodcuts. 1 vol. Cloth. 8vo. 442 pages. \$2.30.

The present work is not simply a reissue, but has been entirely rewritten, and its compass greatly extended.

SATURDAY, AUGUST 27, 1881.

THE CINCINNATI MEETING OF THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The thirtieth meeting of this Society was held at Cincinnati, on the 17th of August and following days, and adjourned on the 23rd.

The meeting opened with some discouraging features, due principally to the marked absence of many of the most prominent members of the Association. Among the absentees we noticed retiring President Lewis E. Morgan, of Rochester; Professor Spencer F. Baird, Professor O. C. Marsh, of Yale; Professor Asaph Hall, of Washington; Professor W. B. Rogers, of Boston; Professor Burt G. Wilder, of Cornell; Professor Simon Newcomb, of Washington; Professor George F. Barker, of Philadelphia; Professor Alexander Graham Bell, of Washington, and Professor Alexander Agassiz, of Cambridge.

It is agreeable to record that in spite of these desertions, which in most cases were unavoidable or due to sickness, the Cincinnati meeting has been in many respects most successful, showing that the "*esprit de corps*" of the great body of the Association is at a high standard and requires no fostering spirit to maintain its vitality.

The following registration shows the attendance of members at the annual meeting since 1869:

1869—Salem.....	244
1870—Troy.....	188
1871—Indianapolis.....	196
1872—Dubuque.....	164
1873—Portland.....	195
1874—Hartford.....	224
1875—Detroit.....	165
1876—Buffalo.....	215
1877—Nashville.....	176

1878—St. Louis.....	134
1879—Saratoga.....	256
1880—Boston.....	997

At the recent Cincinnati meeting the attendance of members was about 550, which compares most favorably with all previous years, excepting the last at Boston, which from various circumstances was a phenomenal year of success.

The growing popularity of the Association, or the increased interest of the masses in scientific matters, is shown by the registration of 400 new names on the roll of the Association, the majority of whom resided in Ohio, Indiana and Kentucky.

An agreeable feature of this meeting was the exhibition of scientific apparatus by those engaged in such manufactures.

Messrs. Beck, Bausch and Lomb, Bullock, Queen & Co., and Sexton for Gundlach showed exhibits, which made it evident that microscopists can command all they desire from the optician, provided the one essential of dollars and cents are within their reach, and even in this respect improvements have been made, which have greatly reduced the expenses of microscopists.

The following gentlemen acted as officers of the association on this occasion.

CINCINNATI, 1881.

President.—GEORGE J. BRUSH, of New Haven, Connecticut.

Vice President, Section A.—WILLIAM HARKNESS, of Washington, D. C.

Vice President, Section B.—E. T. COX, of San Francisco, Cal.

Chairman of Permanent Subsection of Chemistry.—G. C. CALDWELL, of Ithaca, N. Y.

Chairman of Permanent Subsection of Microscopy.—A. B. HERVEY, of Taunton, Mass.

Chairman of Permanent Subsection of Anthropology.—GARRICK MALLERY, of Washington, D. C.

Chairman of Permanent Subsection of Entomology.—JOHN G. MORRIS, of Baltimore, Md.

Permanent Secretary.—F. W. PUTNAM, of Cambridge, Mass.

General Secretary.—C. V. RILEY, of Washington, D. C.

Secretary of Section A.—E. T. TAPPAN, of Gambier, O.

Secretary of Section B.—CHARLES S. MINOT, of Boston, Mass.

Secretary of Permanent Subsection of Chemistry.—ALFRED SPRINGER, Cincinnati, O.

Secretary of Permanent Subsection of Microscopy.—W. H. SEAMAN, of Washington, D. C.

Secretary of Permanent Subsection of Anthropology.—J. G. HENDERSON, of Winchester, Ill.

Secretary of Permanent Subsection of Entomology.—B. PICKMAN MANN, of Cambridge, Mass.

Treasurer.—WILLIAM S. VAUX, of Philadelphia, Pa.

Nearly two hundred papers, described in the following list, were entered to be read.

TITLES OF PAPERS.

1. Magnetic survey of Missouri.—*Francis E. Nipher.*
2. On the effect of prolonged stress upon the strain in timber.—*R. H. Thurston.*
3. Numerical elements of the orbits of the seven Electrical Vortices, to whose motions atmospheric storms are principally due, with the processes by which they have been derived, and examples given of the application of the formula by which their positions on the surface of the earth can be computed for any given time.—*Thomas Bassnett.*
4. Universal Energy of light.—*Pliny Earl Chase.*
5. A new system of interest, discounts, etc.—*James W. Robinson.*
6. The constitution of the "Atom" of science.—*Mrs. A. B. Blackwell.*
7. Cañons, as I have seen them, with some thoughts as to their origin.—*Wm. Bross.*
8. The unification of geological nomenclature.—*Richard Owen.*
9. Recent discoveries, measurements, and temperature observations made in Mammoth Cave, Ky.—*H. C. Hovey.*
10. A remarkable case of retention of heat by the Earth.—*H. C. Hovey.*
11. Coal dust as an element of danger of mining; shown by the late explosion in the Albion Mines, in Nova Scotia.—*H. C. Hovey.*
12. The successful administration of nitrous-oxide for dental and surgical operations.—*C. P. Howland.*
13. An Iso-picraminic acid.—*Charles W. Dabney, Jr.*
14. Development of Sugar in Maize and Sorghums.—*Peter Collier.*
15. A revision of the anatomy of the ethmoid bone in the mammalia.—*Harrison Allen.*
16. The life unit in plants.—*Byron D. Halsted.*
17. On *Bopyrus manhattensis* from the gill-cavity of *Palæmonetes vulgaris* Stimpson.—*Carl F. Gissler.*
18. The uncivilized mind in the presence of higher phases of civilization.—*Otis T. Mason.*
19. The stone images and idols of the mound-builders.—*Wm. McAdams.*
20. Some remarkable relics from mounds in Illinois.—*Wm. McAdams.*
21. Stone implement showing glacier marks.—*Wm. McAdams.*
22. The occurrence of Cretaceous fossils near mouth of Illinois river.—*Wm. McAdams.*
23. Mound-builders' skeleton.—*Watson C. Holbrook.*
24. Stone implements in the drift.—*Watson C. Holbrook.*
25. Prehistoric hieroglyphics.—*Watson C. Holbrook.*
26. A contribution to Croll's theory of secular climatal changes.—*W. J. McGee.*
27. Influence of forests upon streams.—*David D. Thompson.*
28. Alchemy, the cradle of Chemistry. Illustrated by lantern views.—*H. Carrington Bolton.*
29. The great primordial force.—*H. R. Rogers.*
30. "Mixed" or "New Process" sugars. With methods and results of analysis.—*H. W. Wiley.*
31. Amylose. Its nature and method of manufacture. Its optical properties.—*H. W. Wiley.*
32. Relation of reducing power as measured by Fehling's solution to the rotatory power of commercial glucose and grape sugar.—Second paper.—*H. W. Wiley.*
33. On a new material suitable for stop-cocks and stoppers for reagent bottles.—*H. W. Wiley.*
34. The stereoscope, and vision by optic divergence.—*W. Le Conte Stevens.*
35. The nitrogenous constituents of grasses.—*Clifford Richardson.*
36. Mineralogical Notes.—*Benjamin Silliman.*
37. On the influence of the structure of the nerve-fibres upon the production and conduction of nerve-force.—*H. D. Schmidt.*
38. The recurrence of faunas in the Devonian Rocks of New York.—*H. S. Williams.*
39. Note on some Fish remains from the Upper Devonian of New York.—*H. S. Williams.*
40. Note on specimens of *Ptilophyton* and associated fossils collected by Dr. H. S. Williams, in the Chemung Shales of Ithaca, N. Y.—*J. W. Dawson.*
41. Composition and quality of American Wines.—*Henry B. Parsons.*
42. On Dibromiodiacrylic and Chlorbromiodiacrylic Acids.—*C. F. Mabery and Rachel Lloyd.*
43. On Chlortribrompropionic Acid.—*C. F. Mabery and H. C. Weber.*
44. Alhazen's Problem: its history and bibliography, together with various solutions of it.—*Marcus Baker.*
45. Is the law of repetition the Dynamic Law underlying the Science of Chemistry?—*Miss Virginia K. Bowers.*
46. A study of blood during a protracted fast.—*Lester Curtis.*
47. A contribution to the study of Bacterial Organisms, and commonly found on exposed mucus surfaces, and in the alimentary canal of healthy individuals.—*Geo. M. Sternberg.*
48. Suggestions for improvement in the manufacture of glass, and new methods for the construction of large telescopic lenses.—*G. W. Holley.*
49. On the electrical resistance and co-efficient of expansion of incandescent platinum.—*E. L. Nichols.*
50. On recent deep-sea soundings in the Gulf of Mexico and Caribbean Sea, by the U. S. Coast Survey.—*J. E. Hilgard.*
51. Symmetrical method of Elimination in Simple Equations, by the use of some of the principles of Determinants.—*Jas. D. Warner.*
52. A Musical Local-telegraph alphabet.—*William Boyd.*
53. An Improved Sonometer.—*W. Le Conte Stevens.*
54. A new and improved freezing Microtome.—*Thomas Taylor.*
55. A new and Improved Freezing apparatus for use in Surgical and Dental Practice, being a substitute for the ether spray.—*Thomas Taylor.*
56. Bacteria and Micrococci, and their relations to plant culture.—*Thomas Taylor.*
57. Electricity, Magnetism, Gravitation. Their phenomena considered as the manifestation of one force.—*S. S. Parsons.*
58. The Berea Grit of Ohio.—*Edward Orton.*
59. The Gold-bearing drift of Indiana.—*Geo. Sutton.*
60. On the amount of Glacial erosion in Ohio, Indiana and Illinois, with some deductions therefrom.—*E. W. Claypole.*
61. On the Discovery of an Archæmediform Tenestellid in the Upper Silurian Rocks of Ohio.—*E. W. Claypole.*
62. Life-history of the Buckeye Stem-borer. *Sericoris instructana* Clem.—*E. W. Claypole.*
63. Some needed reforms in the use of Botanical Terms.—*Charles R. Ridler.*
64. Digital differentiation.—*A. J. Howe.*
65. The excavation of the Grand Cañon of the Colorado River.—*C. E. Dutton.*
66. On the cause of the Arid climates of the Far West.—*C. E. Dutton.*
67. Evolution and its place in Geology.—*Edward S. Edmonds.*
68. A Short study of the Features of the Region of Lower Great Lakes, during the Great River Age; or notes on the Origin of the Great Lakes of North America.—*J. W. Spencer.*
69. On the inhabitants of N. E. Siberia, commonly called Chukchis and Namollo.—*W. H. Dall.*
70. A Lawgiver of the Stone Age.—*Horatio Hale.*
71. *Ilex cassine*, the Black Drink of the Southern Indians.—*John G. Henderson.*
72. Was the antelope hunted by the Indians on the prairies of Illinois?—*John G. Henderson.*
73. Agriculture and Agricultural Implements of the Ancient Inhabitants of the Mississippi Valley.—*John G. Henderson.*
74. Houses of the Ancient Inhabitants of the Mississippi Valley.—*John G. Henderson.*
75. Comparative Differences in the Iroquis Group of Dialects.—*Mrs. Erminnie A. Smith.*
76. Typical thin sections of the rocks of the cupriferous series in Minnesota.—*N. H. Winchell.*
77. The limited biological importance of synthetic achievements in Organic Chemistry.—*Albert B. Prescott.*
78. On a mesal cusp of the deciduous mandibular canine of the domestic cat, *Felis domestica*.—*Burt G. Wilder.*

79. Remarks on the Classification and Distribution of Producti.—*S. H. Trowbridge*.
80. Note on a comparison of Newcomb's Tables of Uranus and Neptune, with those of the same planets by Le Verrier.—*D. P. Todd*.
81. The Saroscope: Register of eclipses traced from Eden's prime, 3939 B. C.—*A. W. Brown*.
82. Pentachloramyl formate.—*Alfred Springer*.
83. On the features of Equivalence to Chemical Elements, shown by electricity and heat.—*Samuel J. Wallace*.
84. On a sign of logical connection in Equations.—*Samuel J. Wallace*.
85. On an abbreviation in writing a long series of figures, and its use in calculations.—*Samuel J. Wallace*.
86. Retarded Development in Insects.—*C. V. Riley*.
87. New Insects Injurious to American Agriculture.—*C. V. Riley*.
88. The Egg-case of *Hydrophilus triangularis*.—*C. V. Riley*.
89. On the Oviposition of *Prodoxus decipiens*.—*C. V. Riley*.
90. The Cocoon of *Gyrinus*.—*C. V. Riley*.
91. Ozark Highlands.—*G. C. Swallow*.
- 92.—On the disposition of color—markings of domestic animals.—*Wm. H. Brewer*.
93. On the ancient Japanese bronze belts.—*Edw. S. Morse*.
94. On changes in *Mya* and *Lunatia* since the deposition of the New England Shell-heaps.—*Edw. S. Morse*.
95. On worked shells in New England Shell-heaps.—*Edw. S. Morse*.
96. Natural and industrial history of the White Pine in Michigan.—*Wm. Hosea Ballou*.
97. Experiments to determine the comparative strength of globes and cylinders of the same diameter and thickness of sides.—*S. Marsden*.
98. On a convenient method of expressing micrometrically the relation between English and metric units of length on the same scale.—*Wm. A. Rogers and Geo. F. Ballou*.
99. Evidence of atomic motion within liquid molecules, as based upon the speed of chemical action.—*R. B. Warder*.
100. On a new method of applying water power of small head to effect the direct compression of air to any required high pressure.—*H. T. Eddy*.
101. A preliminary investigation of two causes of lateral deviation of spherical projectiles based on the kinetic theory of gases.—*H. T. Eddy*.
102. Phenomena of growth in plants.—*D. P. Penhallow*.
103. On the life duration of the Heterocera (moths).—*J. A. Lintner*.
104. On the action of Pilocarpin in changing the color of the human hair.—*D. W. Prentiss*.
105. On a simple method of measuring faint spectra.—*Wm. Harkness*.
106. On the methods of determining the solar parallax, with special reference to the coming transit of Venus.—*Wm. Harkness*.
107. The sources of the nitrogen of plants.—*W. O. Atwater*.
108. The chemistry of fish and invertebrates.—*W. O. Atwater*.
109. The quantitative estimation of nitrogen.—*W. O. Atwater*.
110. The quantitative estimation of Chlorine.—*W. O. Atwater*.
111. Historic Notes on Cosmic Physiology.—*T. Sterry Hunt*.
112. Upon the use of the Induction Balance as a means of determining the location of leaden bullets imbedded in the human body.—*Alexander Graham Bell*.
113. Upon a new form of electric probe.—*Alexander Graham Bell*.
114. The best method of mounting whole chick embryos.—*Charles Sedgwick Minot*.
115. Note on whether man is the highest animal.—*Charles Sedgwick Minot*.
116. Note on the segmentation of the vertebrate body.—*Charles Sedgwick Minot*.
117. The motion of roots in germinating Indian Corn.—*W. J. Beal*.
118. Exhibition of some archæological specimens from Missouri.—*S. H. Trowbridge*.
119. Animal myths of the Iroquois.—*Mrs. Erminnie A. Smith*.
120. A remarkable invasion of northern New York by a Pyralid Insect (*Crambus vulgivagellus*).—*J. A. Lintner*.
121. On the wave-lengths of the principal lines of the Solar Spectrum.—*T. C. Mendenhall*.
122. How does the bee extend its tongue.—*A. J. Cook*.
123. The Syrian Bees.—*A. J. Cook*.
124. Carbolic acid as a preventive of Insect Ravages.—*A. J. Cook*.
125. A new self-registering Mirror Barometer.—*John R. Paddock*.
126. On the length of life of Butterflies.—*W. H. Edwards*.
127. On certain habits of *Heliconia charitonia*.—*W. H. Edwards*.
128. Notes on experimental Chemistry.—*Albert B. Prescott*.
129. Additional facts on the fertilization of *Yucca*.—*Thomas Meehan*.
130. On the Interpretation of Pictographs by the application of Gesture-signs.—*W. J. Hoffman*.
131. On the great outburst in Comet *b* of 1881, observed at the Cincinnati Observatory.—*Ormond Stone*.
132. An alleged abnormal peculiarity in the history of *Argynnis myrina*.—*W. H. Edwards*.
133. Some new forms of apparatus for the chemical laboratory.—*G. C. Caldwell*.
134. Time service, Carleton College Observatory.—*W. W. Payne*.
135. Note on the theory of the flight of elongated projectiles.—*H. T. Eddy*.
136. On the mechanical Principles involved in the flight of the boomerang.—*H. T. Eddy*.
- 137.—On a convenient form of slide case.—*Robt. Brown, Jr.*
138. A filtration evaporation balance.—*H. Carmichael*.
139. The liquifaction of glass in contact with water at 250° c.—*H. Carmichael*.
140. A new Radiometer.—*H. Carmichael*.
141. A new differential Thermometer.—*H. Carmichael*.
142. On some relations of Birds and Insects.—*S. A. Forbes*.
143. Comparison of Maya dates with those of the Christian Era.—*Cyrus Thomas*.
144. A new theory of the formation of Hail.—*Leonard Waldo*.
145. Method of determining the value of the Solar Parallax from meridian observations of Mars.—*J. R. Eastman*.
146. Numbers of cometary orbit relative to perihelion distance.—*H. A. Newton*.
147. Phonetics of the Kayowe language.—*Albert S. Gatschet*.
148. The needle telephone, a new instrument by Dr. Goodman, of Louisville, Ky.—*J. Lawrence Smith*.
149. Hiddenite, a new American gem.—*J. Lawrence Smith*.
150. Iron with anomalous chemical properties.—*J. Lawrence Smith*.
151. Determination of Phosphorus in iron.—*J. Lawrence Smith*.
152. Nodular concretions in meteoric iron, bearing on the origin of same.—*J. Lawrence Smith*.
153. An anomalous magnetic property of a specimen of iron.—*J. Lawrence Smith*.
154. Regulator of filter pumps.—*J. Lawrence Smith*.
155. Ringing Fences.—*S. W. Robinson*.
156. Niagara River. Its cañon, depth and wear.—*Wm. Hosea Ballou*.
157. On the relations of the growth, size and age of animals.—*Charles S. Minot*.
158. Suggestions of co-operation in furthering the study of entomology.—*B. Pickman Mann*.
159. On Standard Time.—*E. B. Elliott*.
160. The Electrophore and electric lighting.—*E. B. Elliott*.
161. An attachment for burettes avoiding the necessity of using glass stop-cocks.—*Fr. A. Roeder*.
162. On a new form of balances.—*Fr. A. Roeder*.
163. Natural Filtration of water for domestic use in cities.—*G. C. Swallow*.

The next annual meeting of the Association will take place at the City of Montreal under the Presidency of Dr. J. W. Dawson, Principal of McGill College. The election of Dr. Dawson will be a welcome announcement in all scientific circles, and the meeting for 1882 will doubtless be one of the most memorable in the annals of the Association.

We commence this week with the publication of a series of the papers read at the Cincinnati meeting or abstracts prepared by the authors. Those who have not forwarded their communications are requested to do so as soon as convenient. We shall be willing to prepare suitable illustrations, if a request for the same is made at once, to afford time for their preparation.

REPORT ON THE GEOLOGY AND RESOURCES OF THE BLACK HILLS OF DAKOTA. By HENRY NEWTON, E. M., and WALTER P. JENNEY, E. M., Washington, D. C., 1880.

The report on the Black Hills issued six years after the death of its leading observers, to whose name at least it may prove an appropriate monument, comprises the geology, palæontology, mineral resources, lithology and related subjects of interest of that boss of rocks whose circular uplift commands the outstretched plains of central Dakota.

To the *fames sacra auri* may at least be attributed one important service in this connection, as it was a transient disturbance with the Indian settlers, caused by the appearance of gold hunters on their domain, that immediately led to the survey.

The Black Hills had been assigned to the Sioux, and this unauthorized irruption raised the question how far the United States Government might permit a violation of their contract with the Indians, and how much benefit in mineral wealth would accrue to the new explorers

and settlers if their incursions were tolerated. To answer more especially this latter question, and to make substantial contributions to general knowledge, the United States Government instituted a survey of this interesting and unknown country, and to Messrs. Jenney, and Newton, was intrusted its management and direction, under the auspices of the Department of the Interior.

After six months spent in this wild and inhospitable region, members of the survey returned, richly provided with means for a more deliberate examination of its character, and scientific aspects in the laboratories and cabinets of the east.

A delay—one of the innumerable hitches incident to congressional apathy or pre-occupancy—in the appropriation of monies for the printing of their report, invited Mr. Newton to revisit the hills in the spring of 1877 to complete his observations, mend or extend his theories, and here he contracted typhoid fever, of which he died—a loss to science, to society and education.

The work begun under his vigorous and intelligent supervision naturally halted, and although many of its various parts were long since completed, it is only now that in a compiled form they appear in print.

Mr. Gilbert edited the work and undertook the difficult and thankless task of deciphering, compacting and evolving from the *dissecta membra* of Mr. Newton's notes, the part devoted to the discussion of the geology, physical and stratigraphical of these hills. It is not difficult to detect the mind and pen of the author of the "Geology of the Henry Mountains," and whether or not the essay would form an exact reproduction of Mr. Newton's views, it is itself a valuable monograph, instructive and suggestive.

The Black Hills cover an area of 850 square miles, rising from the level and uninhabited wastes about them to an altitude at their highest point of nearly 8000 feet, thickly covered with dense and primeval forests of pine, whose condensed shadows from afar hides all else, and for long marches distinguishes these highlands to the approaching traveller.

The Black Hills, briefly, are an uplift of conformable strata, displaying their consecutive beds in symmetrical succession, from a central axis or elevation, disintegrated and channelled, sculptured and modified by subærial and aqueous erosion. The simplicity and perfection of their stratigraphical structure render them comparatively easy of exposition, and make them a capital example of primary sedimentation, possibly to become classic in future illustrations of geological principles.

The formations, as they are crossed from the centre of the group outward to the circumference, and similarly disposed on every side—*i. e.*, sloping inward to the centre—are the archæan, Potsdam sandstone, carboniferous, shales and limestone, red beds—Trias, Jura—cretaceous and then beyond, upon the plains Tertiary. The central area is a diversified region abounding in park-like expanses, wild and rugged chasms, peaks, isolated pyramids, picturesque gorges, table-lands and a net-work of enfiling streams pouring outward east and west to swell the waters of the Cheyenne and Belle Fourche rivers. This is the archæan area or axis, upon whose flanks repose the higher strata, and in whose gulches and stream beds were found the traces of gold which first brought these hills to scientific notice. This axis lies generally north and south, is slightly arcuate, with its convexity pointing eastward, and is composed of schists, quartzites, gneiss rock, granite, trachytic intrusions and associated metamorphic slates. The granite and quartzites form salient ridges, and the trachyte sharp peaks in the landscape. Next out-cropping underneath the carboniferous is the Potsdam, unconformably bedded upon the upturned edges of archæan slates, carrying characteristic fossils and made up of basal conglomerate, sandstone locally altered around trachytic cones to quartzite, and calcareous beds. This rock has undergone extensive removal along with

the carboniferous strata which surmounts it; indeed, according to the results of the survey, has been removed from the entire uncovered archæan nucleus. Here a remarkable gap occurs; the next succeeding formation is the carboniferous, and we pass from the primordial at one step to the end of the palæozoic strata, with the striking omission of the Silurian and Devonian systems. We are then told that the carboniferous limestone overlies *conformably* this lower rock—a statement hardly credible—that its hard and resistant strata rise in conspicuous relief like an amphitheatric wall around the included and debased archæan area, with a talus of *debris* composed of its own and Potsdam fragments, piled upon its sides. Beyond the mural escarpments of the carboniferous, a trough-like valley encircles the latter formation like a moat, the bottom of which is formed of the Red Beds, probably Trias or Jura. These consist of marls and clays, sandstone or limestone bands, whose soft material has been easily and largely removed. Beyond this again, and rising from it in steep cliffs, the mechanical basis of the cretaceous is met—the Dakota Sandstone—forming the foot hills which encircle as a final group this geological unit. Beyond again stretches the plains of tertiary strata.

The history of the Black Hills, as written by this survey, is this: A low archæan area primarily, whose erosion and degradation has furnished the sands, and fragments of which the Potsdam sandstones, conglomerate, and quartzites have been formed, has been finally overlaid upon submergence with a regular but unconformable sheet of Potsdam rock. The dome thus made has been lifted from the water and for the long time from the Potsdam to the Lower Carboniferous remained dry land, not even subjected—an extraordinary statement—to considerable denudation. Then the carboniferous sea flowed over all and deposited its even floor of limestone over the Potsdam, which two, most regularly superimposed, now form the walls of the archæan inclosure, from which they have been removed by erosion.

The Triassic and Jurassic followed, surmounting the carboniferous with beds of marl and clays, and adding their accumulations to the rising mound of strata.

Lastly, the cretaceous sealed in the column of deposits so that the ideal dome assumed the form of the adjoined section after upheaval.

IDEAL CROSS-SECTION OF THE BLACK HILLS.

|---------------------|----------------|
| 1. Archæan Schists. | 5. Red Beds. |
| 2. Granite. | 6. Jura. |
| 3. Potsdam. | 7. Cretaceous. |
| 4. Carboniferous. | 8. Tertiary. |

Then the uplift occurred which brought these heavy beddings upward in a flat-topped oval displacement, a highland from which, by a process of enormous denudation, the cretaceous and the Jura and Red Beds have been pared away, their slanting beds and monoclinals now surrounding the hills. The carboniferous and Potsdam have also disappeared from the large area on the east side of the dome, where the archæan schists are exposed, and in time will retreat further and further, uncovering new portions of the azoic terrain. The carboniferous now forms the surface rock of the wide western plateau, and is deeply cut by a net-work of anastomosing cañons. A bird's-eye view of the whole presents the aspect of an overturned colossal pastry, with its bottom crust on one

side badly gnawed away. In this place it would be impossible to discuss the serious questions which arise in reference to this exposition. Its guarantee is in the field work and observations of its authors, and it certainly presents a geological chapter of extreme interest.

Prof. Whitfield's important contributions in the palæontology form a striking feature in the report. Mr. Jenney reports, after a detailed examination of the mineral resources of the country, that "the Black Hills are pre-eminent a gold-producing region." Mr. Caswell contributes a chapter on the lithology of the Black Hills.

Very much of general scientific interest is found throughout this handsome volume, and the United States Government have, in its publication, added one more honor to its deserved eminence amongst nations re-organizing science, and added one more debt to the increasing sum due to it from all scientific students.

L. P. GRATACAP.

WASHINGTON, 1880.

THE GREAT PRIMORDIAL FORCE.*

By HENRY RAYMOND ROGERS, M. D., Dunkirk, N. Y.

The law of "*Conservation of Force*" having received the full and unqualified endorsement of all true scientists, is to-day the basis of all physical philosophy and the key to the explanation of all physical phenomena. No view of force can henceforth be accepted which is incompatible with it.

It may be said to be the product of the last half century, its origin being obscure and uncertain. Its earlier conceptions evinced but little promise of the grand future that awaited it, and its advancement, like that of all fundamental truths, has been exceedingly slow. It must be confessed that to-day, even, our knowledge of its provisions is but *rudimentary*. In the way of applying it to the explanation of the mysteries of nature's varied phenomena but little has yet been done. We are confident that whenever this immutable law shall be properly applied, a new era will have dawned upon physical science.

Another fundamental principle of recent discovery has been developed *pari passu* with that mentioned, and in importance is only secondary to it, viz:—the "Unity of Force,"—the correlation of all the forces. It has been demonstrated that all forms of force are resolvable into one another, it is therefore manifest that whatever name, or designation, we may give to these varied forms, but one essence pervades and animates them all. Instead of many independent forces, set forth in an irrational, contradictory, and mostly complicated philosophy, actually there exists *One Great Primordial Force*; simple in its character, competent to explain all physical phenomena, and in harmony with the nature of things. It is the force that rules the universe of matter,—innumerable star-suns and minutest atoms alike; and, for its realm, it has the vast bewildering space and all the cosmical bodies which occupy its depths.

This force is real and *substantial*. "Conservation of force proves as certainly as it proves anything, that all force is substantial. Nothing can be conserved, or preserved, unless it is something that exists, and it seems to be an axiomatic truth that nothing can exist unless it be a substance of some kind. If force in one form is convertible into force of another form, then all force in whatever form it may be exerted is substance, since it is impossible to conceive of the conversion of one thing into another thing, and neither thing be anything substantial. Our inability to take cognizance of the constituents, or corpuscles of a force, is no valid reason to a thoughtful

* Read before the A. A. A. S., Cincinnati, 1881.

mind why such force should not be regarded as a real substance—as literally and truly an entity, as is the air we breathe.”

The two fundamental principles having been ascertained, our acquaintance with the essential nature of the primordial force depends upon the use we make of our positive knowledge of the specific operations of the several forms of force, as now, for the first time, we are enabled to understand and interpret them. Since we are just beginning to appreciate the great law of conservation of force and the great fact of the unity of all the forces, a better reading of physical phenomena is rendered possible. By these data we plainly read that this force is *electric* in its constitution. We claim that the electric theory is a factor in the explanation of all the phenomena.

We are able to perceive that a great celestial battery is in operation, to which the primordial force owes its perpetual development; a battery differing from our own magneto, and dynamo-electric batteries only in scale of operation. It has the same essential constitution, and *modus operandi*. Quite like the battery of man's construction, the celestial battery requires the co-operation of two elements, either of which, acting independently, is incapable of producing force, but acting in concert, the two develop all known forces of the universe. These two elements which have never yet been adequately associated in the interpretation of the phenomena of gravity, heat, light, etc., are *motion* and *magnetism*; the motions of the celestial spheres, and the magnetic constituent of each celestial sphere. True, the scientific world has vaguely conceived of the development of power through the agency of celestial motions, but it has failed to formulate any *exact philosophy* of the manner in which those motions should develop actual force. Such a philosophy is accessible.

It is known that the earth is a vast magnet, having a magnetic axis nearly corresponding to its geographical axis, and terminating in a *positive*, or northern pole, and in a *negative*, or southern pole. But the earth's inherent magnetic force must remain purely *potential*, or *static*, and without the ability to act, or to move, except through the co-operation of a separate and independent force, whereby this static magnetism may be converted into active, vital currents. From our experience with the electric battery, we know that motion, and change of polarity, are capable of producing vital, active force, from force inert and dormant. In the celestial, as in the terrestrial battery, motion and change of polarity are prerequisite to the awakening of inert, dormant force, into vital, active force.

That electricity may be obtained from magnetism by motion, or that magnetism, conjoined with motion, may be made the source of electricity, is well understood. So, by their unceasing rotation the magnetic sun and earth furnish both the needed motions, and the incessant change of polarity, which are requisite to the completion of the celestial battery. Thus, through the medium of revolving celestial armatures, acting upon celestial magnets, *statics* are converted into *dynamics*, on a scale commensurate with the demands of the universe; and that dream of the ages, *perpetual motion*, is found a realized fact in nature.

All space being pure vacuum, distance is virtually annihilated, and all the spheres are brought relatively into close proximity. Mercury, 37,000,000 of miles from the sun, and Neptune 2,800,000,000 of miles, stand alike in their relation with the great central orb. This condition is thus favorable to such “*action at a distance*,” as is found *indispensable* to the inter-communications going on between the bodies which constitute the universe of matter. The fact of instantaneous action at a distance, and without a medium of transmission, though questioned, is demonstrated in the action of gravity.

Through the operation of the celestial battery a great

current of force is incessantly in motion from the sun to the earth. Both the law of conservation, and the law of magnetic action, demand that a current of equal proportion shall as incessantly return from the earth, to the sun;—the one current cannot for a moment exist without the other. Were this return current interrupted, the light of the sun would instantaneously cease, all life would become extinct, and, the power of cohesion being suspended, the earth and everything thereon would return to their original elements, and vanish into space. In this action, and retro-action, we find a grand magnetic circuit between the earth and sun, through the operation of which the earth's portion of the primordial force is utilized. The same conditions which exist between the sun and earth, as described, exist also between every satellite and its primary, and between the star-suns of the universe.

SOLOMON was wiser in some respects than the scientists of the present day. He says that “The wind returneth again according to his *circuits*. All the rivers run into the sea, yet the sea is not full; unto the place from whence the rivers come, thither they return again.” Science recognizes the immense movement of force from the sun to the earth,—but has she made sufficient account of the fact that the earth is not full? Has she recognized the fact that back to the sun again, in some form or other, the rivers of energy must return in ceaseless circuit? And yet, the law of conservation demands it, and the electrical theory satisfies the demand.

The various manifestations, or affections, of the primordial force which receive the appellation of the great physical forces have their fullest and clearest explanation through the interpretation given by the electrical theory.

GRAVITY CONSIDERED AS AN AFFECTION OF THE PRIMORDIAL FORCE.

Science has strangely neglected to examine the field which gives best promise of an ultimately satisfactory explanation of this phenomena.

According to the present popular philosophy, “gravity acts directly as the mass, and inversely as the square of the distance.” FARADAY says, “The received idea of gravity appears to me to ignore entirely the principle of the conservation of force, and, by the terms of its definition, if taken in an absolute sense, ‘varying inversely as the square of the distance’ to be in direct opposition to it.”

If gravity acts directly as the mass, then surely, as the sun's mass is *constant*, and the earth's mass is also *constant*, the force of attraction should at all times remain invariable, and the earth's orbit should consequently be a true circle, instead of an ellipse. If gravity acts inversely as the square of the distance, then the earth at aphelion could not without the aid of some other force or interfering cause, be returned to perihelion, but the lessening attraction would permit it to move on indefinitely into space.

The electrical theory, however, suggests a more rational, clear, and satisfactory philosophy, and makes provision for the elliptical orbit of the members of the solar system. In order that the earth's orbit, for example, should be elliptical, the mutual attraction existing between the sun and the earth must necessarily increase and diminish with mathematical exactness and regularity. To such *regularly varying attraction*, and to no other cause, can the ellipticity be due. Attraction is greatest about the 21st of December when the two bodies are nearest each other, and least about the 21st of June, when they are relatively the most distant. Whether the attraction between the sun and earth shall be greater, or shall be less, depends altogether upon their relative position. Thus when the earth's south-pole presents nearest the sun, the attraction between the two bodies is the greatest, and when the earth's north-pole so presents,

attraction is least. Why should this variation in position produce such a variation in attraction? In the light of the electrical theory the following explanation is confidently advanced:

On the 21st of December the *positive* sun, (S.) and the *negative* south-pole of the earth's magnetic axis (N.) are in closest relation to each other, and the north-pole, (P.) is out of the field, therefore the opposing conditions, viz: the *positive* sun, and the *negative* portion of the earth, represented by the south-pole, acting in concert, produce attraction between the two bodies, according to the electrical law that *unlikes* attract each other. At that date the centre of the great electric sun-current strikes the earth at a point $23\frac{1}{2}$ degrees south of the equatorial line, and from thence moves in the direction of its mass towards, and along the earth's natural magnetic axis; in this instance, towards the north. This northerly movement of the electric mass is *concurrent* with the earth's magnetic axis, and the force of attraction between the two bodies is thereby increased to its maximum.

On the 21st of June precisely opposite conditions exist: the *positive* sun, and the *positive* north-pole, are in closest relation to each other, and the south-pole is out of the field; attraction between the two bodies is consequently at that date lessened, and this in accordance with the electrical law that *likes* repel each other. And, too, the centre of the great sun-current strikes the earth at a point $23\frac{1}{2}$ degrees north of the equator, and its mass moves in a southerly direction. The direction of this electrical movement is *contrary* to the earth's natural magnetic axis, and the force of attraction between the two bodies is further lessened; consequently at that date they are found at their greatest distance apart,—viz: several millions of miles more distant than on the 21st of December.

On the 20th of September, and the 20th of March, the sun is equidistant from the earth's two polar extremities, and the centre of the great sun-current strikes the earth at the equator in a direction at right-angles with the earth's magnetic axis. The electrical conditions are thus balanced, and the earth at those periods is equally distant from the sun.

The degree of ellipticity of each planetary orbit is due to the inclination of its axis: if the axis is at right angles with the plane of the ecliptic, the poles must be equidistant from the sun, and attraction and repulsion thus become equalized, and the orbit must necessarily be circular. Had the axis of the earth been perpendicular to the plane of the ecliptic, the sun would always have appeared to move in the equator, the days and nights would have been equal, and there could have been no change in the seasons.

The extent of ellipticity in any orbit is governed by the amount of axial divergence from such right-angle.

As a further demonstration of the ability of the electrical theory to account for the grand phenomena of the universe, we will apply it to the philosophy of the earth's axial motions. Electricity and Magnetism are regarded by

scientists at the present day as virtually identical. The correlation of heat and magnetism is apparently as pronounced, as witness certain natural phenomena which bear directly upon this point. The tropical plant, the *phytolacca electrica*, is known to produce marked electrical effects; a touch of a twig gives to the hand as vivid a shock as that of a Rumkorff battery. At the distance of seven or eight paces, the influence of the plant is manifested through a compass needle, the closer the proximity, the more marked are the demonstrations; and if the compass is placed in the centre of the bush, the movement of attraction previously shown by the needle is changed into that of rapid rotation. The intensity of the phenomena varies with the time of day. At two o'clock P.M. it attains its maximum, and at night its magnetic powers are scarcely perceptible. It is thus demonstrated that at precisely the same hour, viz: two o'clock P.M. *heat* intensity, and *magnetic* intensity are *co-incident*. From this hour each diminishes, and from the morning until two o'clock P.M. each increases in the same proportion. The hour of the least magnetic effect, or the most *negative* condition, is shown by the following phenomenon to occur at a period of time opposite to that of its maximum, or *positive* condition, viz: two o'clock A.M. It is the experience of miners whose lives are passed in the depths of the earth, that between twelve and two o'clock in the night, if there is a loose stone or bit of earth in the mine it is sure to fall. Says a miner of many years experience: "About this time it seems that everything begins to stir, and soon after twelve o'clock, although the mine has been as still as the tomb before, you will hear particles of rock and dirt come tumbling down, and if there is a caving piece of ground in the mine it is sure to give way."

From these and such like familiar suggestions on the part of nature we may infer that the portion of the earth which is at any given time specially under the action of the great sun-current, becomes *electro-positive*, the maximum intensity occurring at two o'clock P.M. During the night the magnetic condition changes, and is at two o'clock A.M. most *electro-negative*. Thus at two o'clock P.M. the sun on the one hand, and that portion of the earth on the other hand, being in like electrical conditions, viz: *electro-positive*, mutually repel each other, and the consequent *push* moves the earth in revolution. The revolving earth turning eastward, is continually carrying its *negative* condition of the night into the field of the *positive* sun, a mutual attraction therefore takes place with its consequent *pull* upon that side; and thus is generated the process of an incessant attraction on the east side, and of repulsion on the west side, giving to the earth its axial motion.

Gravity may therefore legitimately be claimed as purely an electrical phenomenon.

The words of the grand old FARADAY now stand forth in lines of light, viz: Gravity, surely this force must be capable of an experimental relation to electricity, magnetism, and the other forces, so as to bind it up with them in reciprocal action, and equivalent effect.

SUN HEAT, as an Affection of the Great ONE-FORCE.

The demonstrations of our senses, as well as the teachings of all the ages, lead us to attribute to the sun the possession of a most dazzling brilliancy, an unlimited amount of heat. So it certainly appears. Yet the simple fact that the earth receives its heat through the agency of the sun, is not conclusive evidence that the sun is itself hot. On the contrary, it is well known that heat rapidly diminishes in the direction of the sun, and that at the altitude of considerably less than three miles lies the line of perpetual frost, the temperature of space progressively lowering beyond that point. The space therefore which separates the earth from the sun, 93,000,000 of miles in extent, is inconceivably cold; its intensity is variously estimated at from *minus* a few hundred degrees, (Fahr.) to

minus 18,000,000 of degrees. It seems incredible that scientists who possess the knowledge of these facts can entertain the thought, or attempt to maintain the theory, that heat comes from the sun, *as heat*, through such a distance, and such a medium. And, if not coming as heat, then the previously existing philosophies of the functions of the sun are *fundamentally erroneous*.

Science at the present time admits of four different explanations of the production of sun heat, viz: (1.) combustion of cosmical substances falling into the sun; (2.) arrest of motion of substances thus supposed to fall into the sun; (3.) contraction of the solar mass; and (4.) dissociation of compound bodies in the sun's substance. Each of the foregoing hypotheses stands in direct opposition to the inexorable law of conservation of force. Each recognizes the presence of a vast flood of heat, light, and force incessantly issuing from the great solar mass, and proceeding therefrom with inconceivable velocity to the earth. Yet neither of them makes provision for the retro-acting, or returning current, which under the law of conservation, becomes indispensable. Each assumes the actual and indispensable presence of heat at the sun, as an element in the solar economy. But inasmuch as heat cannot come from the sun *as heat*, there really exists at the sun no necessity for the enormous production there, such as these hypotheses demand. The prodigious destruction of material claimed to be involved in the production of heat at the sun, and the expenditure of an inconceivable amount of force in projecting the same in all directions, and to inconceivable distances into space, are uncalled for, and therefore irrational. Upon the electrical theory, no such extravagant and irrational processes are needful.

A true understanding of the great physical phenomena of our earth depends upon a correct knowledge of the constitution of its atmosphere. There is a more vital element than clouds, vapors, gases. This constituent is magnetic in its character, and may be designated as *static*, from its habit in equilibrium, and also in contradistinction from the vast *active* current which fills the space between the sun and the earth. In all scientific formulæ of its constitution, this principle as a real entity has been ignored. The fact that the atmosphere is a vast magnetic reservoir, that it is the most magnetic of all earthly bodies except iron, nickel, and cobalt, is well understood; yet there appears to have been no suspicion of the grandeur and importance of its functions in the earth's physical economy. As constituted, the atmosphere is peculiarly adapted to co-operate with the sun in this economy.

In fact it is the medium and instrument of all the sun's terrestrial operations. Prepared by such knowledge of the constitution of the atmosphere, we can better comprehend the philosophy of the action of the great sun-current so incessantly moving earthward.

By means of the dynamo-electric machine, it is demonstrated that motion or magnetism, (or both,) is converted into heat and light; so does not analogy suggest that the grand motions of the heavenly spheres are by the same principle converted into sunlight, and sun-heat; thus making unnecessary the measureless and ceaseless destruction of material that is demanded by the present theory? Our atmosphere supplies the conditions represented by the "carbon point," and the "platinum coil," in practical electricity. A current invisible, without manifestation, passes through space, as electricity through wires, until, meeting the resistance and favorable conditions of our atmosphere, there occur those wonderful and important phenomena, heat, and light. No particle of either heat or light need therefore come as such from the sun to the earth, the current being wholly invisible and cold in its passage. For a practical demonstration of such transmission of a current, we are much indebted to experiments made by Prof. MAHLON LOOMIS, of WASHINGTON, D. C. Without any visible means of transmission, he succeeded in sending the mag-

netic current from one mountain top to another twenty miles distant.

In the light tenuous atmosphere of the summits of lofty mountains, the human body often experiences the fiercest effects of sun-heat, and the pyrheliometer of POUILLET also records such effects for the reason that the body and the instrument become *objects of resistance* to the current, and a local heat is thus developed, which is far greater than that of the light atmosphere surrounding, which offers no such resistance. It is hardly necessary to add that the greater heat always manifested on the surface of the earth beneath is owing to the fact of a denser medium, and a consequent greater resistance.

The battery of mundane construction—our best aid and interpreter in the reading of universal phenomena—while it is the developer of heat, light, and power, is itself neither luminous, hot, nor magnetic. To explain the effects of the sun, therefore, there is not the least reason to infer that it is itself luminous, or even warm. Potential action generated in a dark, cold body may produce great heat, light, and attraction, at a distance from the seat of activity, and what is thus wrought artificially, in a small way, may surely be done naturally, and in a tremendous fashion, by the grand forces of the sun.

SUNLIGHT.

The same process develops sunlight. If lines be drawn from the sun to the earth, tangent to both, these lines will enclose a tapering space, the sun at the big end, the earth at the small end, and the space between a truncated cone; this space may be designated the solar cone or cone-space. Within this space incessant circulation is going on, and all the phenomena of gravity, heat, light, are produced through their reciprocal activity. The field of encounter between the forces of the sun and earth is our atmosphere, and in the collision light is generated. Being thus conditioned upon the atmosphere, light and heat cannot be found in space beyond the lines of the solar cone.

It is to be observed that light rapidly diminishes in the direction of the sun, even as we have seen to be the case with heat. Beyond the lower portion of the atmospheric mass, there is no dazzle; and the human eye in looking upon the great orb is not dazed. Thus the exceeding brilliancy which characterizes the sun's rays, so far from being a phenomenon located in the sun itself, as is the popular, and even the scientific conception, is actually confined to the lower strata of our atmosphere.

If light were transmitted to us from the sun in perfect intensity, the entire vault of heaven must appear as luminous as our sun.

The sun is therefore not the manufacturing place and distributing reservoir of *actual* light and heat; it is rather the source from whence the whole solar system is supplied with the *invisible, potential* light and heat, which become developed where it is required. The great central orb may therefore be regarded as like unto the earth, on its surface, and in its surroundings, viz: a dark, cool, habitable body.

OTHER RECOGNIZED FORMS OF FORCE.

All other recognized forms of force have their best explanation in the same theory.

It may be necessary to caution against a natural misconception which is fruitful in seeming objections against the theory advanced. Let it be understood then, that man's machinery must always work to disadvantage when made to illustrate the operations of nature. The machine itself is an inert thing, a dead weight interposed, the working of which requires the expenditure of force. In nature's operations, on the contrary, without labor or friction, one form of force under proper conditions transmutes itself into another form, there being no loss of force in the change. We must recognize the fact of an unimpaired energy in the universe, the fact that force is never lost nor wasted.

The Great Primordial force owes its genesis to the initial impulse which set all spheres in motion in vacuous space. To this universal principle, not only all physical force, but new life itself is due.

HUMBOLDT says: "It is indeed a brilliant effort, worthy of the human mind, to comprise in one organic whole the entire science of nature, from the law of gravity to the formative impulse in animated bodies."

That the earth, and the sun, and all the heavenly bodies, are possessed of the mysterious magnetic energy, and consequently exert a powerful magnetic influence over each other, has long ago been conceived by such men as HERSCHEL, HUMBOLDT, FARADAY; and is the faith of scientists to-day. But when we have arrived at such a conclusion, it is impossible for us to stop short, and not make the necessary deductions therefrom. Mighty magnets, when involved in mighty motions, must produce mighty currents and mighty effects. It is not for nothing that these powers and conditions exist. If we admit the premises, we must not ignore the conclusions that are necessitated. Provision must be made for the outcome of every admitted fact in science.

Therefore, it is with assurance that we urge the electric theory, and maintain that the burden of proof rests with those, who, admitting the elements of motion and magnetism, have yet made no provision whatever for their keeping.

Besides, there are two other principles already alluded to—the conservation of force, and the unity of all the forces—with respect to which it may be demanded, to what other result do they lead, and can they lead, in all reason and logic, than to the admission of the grand fact of a Great Primordial Force.

THE TIDAL EVOLUTION OF THE MOON.

On Saturday, June 4th, in the Museum Buildings, Trinity College, Dr. Ball, Astronomer Royal for Ireland, delivered an interesting and instructive lecture on recent discoveries in astronomical science. Dr. Ball said that from the variety of topics which might fairly be dealt with in his lecture he would select three, and in making this selection he had been mainly guided by the relative importance of different astronomical problems. He had also endeavored to exercise his choice so that his lecture should, as far as possible, refer to the various branches of astronomy. Having dealt with two branches of his subject, Dr. Ball described "Darwin's Theory of the Tidal Evolution of the Moon." It had, he said, been the triumph of modern gravitational astronomers to indicate the changes which must be going forward in a system devoid of rigidity. It was at all events easy to show that the tendency of these changes lay in one direction, and this was the most important point for consideration. Everyone was aware of the daily movements of the sea, which were called the tides. Most people were aware that the movements of the waters were caused by the attraction of the sun and the moon. Let them ponder therefore on the tides, as they seemed to give a clue to some of the profoundest of nature's secrets. He had heard that the port of Dublin was gradually being improved by the deepening of the bar. He had heard that the deepening of the bar had been attributed to the judicious action of the Port and Docks Board. But what the board had chiefly done was to call into requisition the scouring power of the tide, which, as he was informed, was gradually reducing or bearing away the bar. The tide was therefore accomplishing, at the bar of Dublin, the same kind of work as could be accomplished by men or by steam-engines. In other words, the tide was here doing a useful work that could otherwise only be done by the expenditure of energy. It was the same elsewhere. The tides were doing work useful or the reverse, and expending energy in so doing. Where did the energy come

from? It could not be created. It could only come from the store of energy available for such purposes in the solar system. The reserve energy whence the tides drew the supplies they were daily consuming consisted partly in the daily rotation of the earth on its axis. The earth was like a mighty flywheel which would absorb a prodigious amount of energy in setting it in motion, and which would give out that energy before it would be brought to rest. The rotation of the earth on its axis was a vast but not inexhaustible storehouse of energy, on which the tides could draw for thousands of years. Energy also existed in the solar system in many other forms, some of which could also be rendered available for the tides. So far as was known, the total amount of energy could not be increased. The important question was—Can that total ever be diminished? The tides were diminishing it every day. The small oceanic tides were not the sole source of the expenditure. The solid body of the earth itself must be subject to tides; still more must the fluid or gaseous members of our system be subjected to tides. All tides involved friction, and all friction involved loss of energy. Here, then, was the great discrepancy between the theory of Lagrange and the actual condition of our system. Lagrange's calculations assumed that the total energy of the solar system was constant, but the actual fact was that the energy was slowly diminishing. The tracing of tidal evolution was chiefly due to the labors of Mr. G. H. Darwin, son of the celebrated naturalist. The influence of the tides had already been recognized as the cause of the same face of the moon being always bent on the earth. Whether the tides were merely oceanic, or whether they were actual bodily tides, the results remained much the same. At the present time the moon revolved around the earth in a month: the earth revolved on its axis in a day. The tides produced in the earth by the moon must act to reduce the rate of the earth's rotation. The effect of the tides on the earth was to lengthen the day. The day was gradually lengthening, but this change could not take place without a reactionary change on the moon. The change undergone by the moon was perhaps a little difficult to understand, as it depended on some by no means simple dynamical principles. The friction of the tides consumed the energy of the system. It turned a large portion of that energy into heat, which was then radiated off into space to be forever lost. But the friction of the tides could not alter the moment of momentum of the system. As the earth became gradually slower and slower in its rotation its moment of momentum decreased, yet for this to happen the moment of momentum of the moon should increase. It followed mathematically that as the tides gradually made the earth rotate more and more slowly, the moon must be getting farther and farther away from us. At the end of a million years from the present time the day will be more than one day of twenty-four is now; and in one million years hence the moon will move round the earth at a greater distance than she does now, and the length of the month will be correspondingly increased. In the far distant future therefore, we are to look for an increased length of month. The length of day will, however, increase much faster than the length of the month, until at length the duration of the day equals that of the month. When this time arrives the moon will have moved out to a distance half as great again as it is at present, and the length of the month will have increased to two months. Our day will then have increased from twenty-four hours up to nearly two months, and as the moon continues to show the same face to us, we are destined to turn the same face on the moon. Were the earth and the moon the only bodies in the universe, such a state of things might go on forever. The sun, however, will produce tides in the earth which will again modify their movements. He had said that the moon was gradually receding farther and farther from the earth, and that the

length of the day was increasing—getting gradually longer and longer. But how long has this been going on? Yesterday was shorter than to-day. The day which Homer had was shorter than our day, but not indeed to any appreciable extent. There can be no doubt, however, that a million years ago the day was appreciably shorter than the day is at present. He wished to conduct them back to an exceedingly remote period, to a critical epoch in the history of the earth. That epoch must have been more than fifty millions of years ago, but how much more he could not tell. At that extremely remote time the day was greatly less than it is at present. It was only, indeed, a fraction of its present amount, being only from two to four hours long. He would trace back the moon to the same remote epoch to which he had conducted the earth. The tides in the earth are forcing the moon gradually away from us at present. The moon was therefore formerly nearer to us than it is now. Millions of years ago the orbit of the moon was much less than it is at present. The time of the moon's revolution was much smaller and the moon must have been quite close to the earth, and whirled round the latter in a period of from two to four hours equal to the period of the earth's revolution on its axis. Such, then, is the primeval condition of things to which the tracing of tidal evolution conducted. Antecedent to this critical epoch they could hardly go with any degree of certainty. After explaining Darwin's theory in reference as to the supposed rupture of the earth at a very remote period of time, and the consequent formation of the moon, the lecturer proceeded to speak of the surprise with which astronomers realized that the small interior satellite of Mars revolved on its axis in less than a third of the time—nearly 24 hours—which the primary occupied in revolving on its own axis. He also spoke of the tremendous forces in action at remote periods when tides rose to a height of a thousand or two thousand feet, scouring rocks and carrying enormous quantities of matter to the sea, and when that action caused so much comparatively rapid manufacture of strata.

MR. DARWIN ON DR. HAHN'S DISCOVERY OF FOSSIL ORGANISMS IN METEORITES.

Dr. Hahn's discovery, of which an elaborate account was given in No. 50 of SCIENCE, has stirred up a lively discussion of this highly interesting subject. Dr. Hahn has taken steps to enable Prof. von Quenstedt, the renowned Tübingen geologist, and all others who expressed the desire to examine his microscopic preparations. It is understood that all those who have availed themselves of the opportunity thus offered have become convinced of the genuineness of Dr. Hahn's discovery.

It is very interesting to note the position taken by the greatest of living evolutionists in this controversy, if it can still be called such. Charles Darwin, on receipt of Dr. Hahn's work, wrote to him:

" . . . It seems to be very difficult to doubt that your photographs exhibit organic structure . . .," and furthermore:

" . . . your discovery is certainly one of the most important."

Not content with the mere presentation of his work, Dr. Hahn visited the veteran zoologist and brought his preparations to him for inspection.

No sooner had Mr. Darwin peered through the microscope on one of the finest specimens when he started up from his seat and exclaimed:

" Almighty God! what a wonderful discovery! Wonderful!"

And after a pause of silent reflection he added:

" Now reaches life down!"

The latter remark no doubt refers to the proof furnished by Dr. Hahn's discovery that organisms can reach

our planet from celestial space. It is an acknowledgment of the relief Mr. Darwin must have felt in not being forced to a belief in a primeval "*generatio equivoca*."

As was suggested in the paper referred to, "the Richter-Thomson hypothesis of the origin of life on the earth has become a tangible reality!" R.

AN AFTERNOON ON PASSAIC RIVER.

On the 25th day of last month the editor, in company with his former colleague on the *Quarterly*, Mr. J. L. Wall, escaped from the city and made a trip to the town of Belleville, on the Passaic River. A row-boat was engaged, and we proceeded to collect specimens from along the shores. Not many species of algæ were found, nor was there any great variety of animal forms, but the water-plants, so hardy and useful in aquaria, the *Anacharis Canadensis* and *Vallisneria spiralis*, were abundant. Reaching over into the shallow water, it was an easy matter to obtain perfect plants of *Vallisneria* with good roots, and we collected a number of them. The *Anacharis* grows so readily without roots that the more fresh looking stems were carried home without regard to the roots. An old can was made use of to carry home some of the river mud, in which to plant the *Vallisneria*. The mud was placed in the bottom of a tall speciej jar, the roots of the plant were properly embedded, and the jar filled with water. The next morning, after the water was cleared by settling, the mud was covered with a layer of clean sand, which tends to prevent riling of the water by a slight disturbance. All the leaves of the *Vallisneria* were removed, so that a new growth might start in the aquarium. It is probable that we will thus obtain some vigorous plants of *Vallisneria* for use during the coming winter. The *Anacharis* was simply thrown into a large aquarium, where it will doubtless grow without further care. Rowing about slowly, a long, green, spiral filament was observed reaching up to the surface of the water. It was two or three feet in length, and bore a peculiar flower at the end. This was the female flower of *Vallisneria*, a very interesting object for study; it was quite a surprise to us, as the plant does not usually flower as early as July. Looking toward the shore, the water was covered with an innumerable quantity of white specs, which attracted our curiosity. Rowing up to them, we found that they were the male flowers of *Anacharis*. These are very curious flowers. The long, tubular perianth, sometimes two or three inches in length, reaches from the axil of a leaf to the surface of the water, and bears the stamens above. It would easily be mistaken for the flower-stem, but it is really the tubular perianth. These flowers were very abundant, so that the water appeared white with them. The pollen-grains were numerous, and could be seen floating about on the water in little clusters resembling snow-flakes. *Potamogeton* was abundant, in several forms, and the common arrow-plant, so named from the shape of the leaf, *Pontedaria cordata*, which is also good for large aquaria. This plant should be set in a flower-pot, with suitable soil in which to root, and then submerged, either wholly or in part.

Among the algæ, two species of Oscillariaceæ were found quite actively moving *Oscillaria tenuis* and *littoralis*, and *Lyngbya majuscula*. The most interesting specimen of all, however, was a species of *Ulothrix*, a very common, filamentous, green algæ, in which the cells are about as long as they are wide. It was interesting because when we examined it, at about seven o'clock the next morning, the process of giving off swarm-spores had just begun. The entire contents of each cell in whole filaments, quickly formed into green, spherical masses, which began to move about in the confined space within the cells; soon the cell-walls ruptured, and the contents escaped as very active swarm-spores, somewhat elongated in form, and furnished with four long, whip-like appendages, or flagella, by means of which they could

swim about. They measured 5.8 to 8μ ($.00022$ to $.00033$ -inch in diameter). After a while they become attached to some object, lose their flagella, elongate and subdivide, forming new growths of *Ulothrix*.—*The American Monthly Microscopical Journal*.

SELENOGRAPHICAL.

For the purpose of comparing drawings of lunar objects, it is proposed to circulate at frequent intervals, among observers, a portfolio containing sketches and descriptions of various formations, which will ultimately be presented to the Selenographical Society. To cover expenses, an annual subscription of 2s. 6d. will be required. Among those who have already signified their intention of joining in the movement are Rev. F. B. Allison, Mr. W. R. Birt, Mr. T. P. Gray, Rev. R. S. Hutchings, and the Rev. Dr. Richards. Those who are willing to add their names to the above list are requested to communicate with the editor of "SCIENCE."

BOOKS RECEIVED.

SEA MOSSES. A Collector's Guide and an Introduction to the Study of Marine Algæ, by A. B. HERVEY, A.M. S. E. Cassino, Boston, 1881.

We welcome this excellent book, published at a seasonable moment, which will make it doubly appreciated by the public.

To the thousands who are now making a temporary home within the sound of the surf and who love the sea, seeking its presence for rest of spirit or health of body, the present work will be found a welcome companion and guide, opening up a new channel for the pleasant passage of leisure hours. No longer need the idler watch the incoming and outgoing of the tides with listless indifference, or be weary of the beating of sleepless waves, as they go tumbling among the rocks.

The author prepares the way for another pleasure which "this great and wide sea" can give us, besides that which she offers to our fancy and our dreams. In the contemplation and study of the exquisitely beautiful flora which she nurtures in her ample waters.

If you become acquainted with these plants, their beauty, delicacy and grace, and know their names, habits and history, you will admit the sea has added a new charm to your existence.

There may be no royal road to knowledge, but Mr. A. B. Hervey has certainly selected the shortest and most agreeable path by which the tyro may acquire a practical knowledge of the department of Cryptogamic Botany, included in the study of the most beautiful of Marine Algæ, the Sea Mosses.

The publishers have done justice to Mr. Hervey's work, and have produced a handsome printed book of nearly 300 pages, with twenty full-page colored illustrations of the most beautiful of the Sea Mosses, which will be found of great value to the student engaged in these studies.

No person of intelligence residing within reach of the sea, should remain without a copy of this work.

PROF. S. P. LANGLEY has made the following calculation:—A sunbeam one square centimeter in section is found in the clear sky of the Alleghany Mountains to bring to the earth in one minute enough heat to warm one gramme of water by 1°C . It would therefore, if concentrated upon a film of water $1/500$ th of a millimetre thick, 1 millimetre wide, and ten millimetres long, raise it $83\frac{1}{2}$ in one second, provided all the heat could be maintained. And since the specific heat of platinum is only 0.0032, a strip of platinum of the same dimensions would, on a similar supposition, be warmed in one second to 2603°C .—a temperature sufficient to melt it!

NOTES.

FAURE batteries are now made with flat plates, the rolling up of the sheets having been found to produce many cracks in the minium.

FROM exact experiments, M. Mascart finds that the intensity of current capable of producing in one second the electrolysis of the equivalent of a substance expressed in milligrammes is equal to 96.01 webers.

REMSEN has again investigated the action of finely-divided iron in inducing the formation of cyanide when nitrogen is passed over a hot mixture of carbon, iron, and an alkaline metal; he finds that freshly reduced iron induces a large formation of cyanide, but that iron after keeping for some time loses this power.

THE PHYSIOLOGICAL EFFECTS OF MATE.—Maté, or Paraguayan tea, is known to be extensively used in South America, and almost universally in Brazil, the common practice being to pour boiling water on some of the powder (consisting of ground leaves and twigs of certain species), then to suck the infusion through tubes provided with strainers. MM. d'Arsonval and Conty have recently inquired into the action of this substance, administering it to dogs, either by injecting into the veins or by introduction into the stomach, and they have observed a remarkable effect of it on the gases of the blood. It diminishes the carbonic acid and oxygen both of the arterial and of the venous blood to a large extent, sometimes a third or even half of the normal quantity. This action, which is less intense during digestion, and has no necessary relation to phenomena of excitation of the sympathetic nerve-system, is somewhat obscure as to its "mechanism," but its existence proves directly the importance and nutritive value of the aliment in question, which, consumed in such large quantities in South America, is almost unknown in Europe.

PROF. IRA REMSEN, of the Johns Hopkins University, Baltimore, has been lately experimenting as to whether the chemical behavior of a metal is in any way influenced by magnetic action, and has obtained some interesting results. The best effects were got by placing a shallow, thin iron vessel holding copper sulphate solution over the poles of a magnet. Out of the magnetic field the solution would deposit a uniform coating of copper, but in the field the lines marking the outlines of the poles were sharply distinguished as depressions in the deposit. In this case a permanent magnet was used capable of supporting 55 lbs. With an electro-magnet still more striking effects were observed. There was no deposit of copper on a narrow space marking the outline of the poles. Within this the deposit was fairly uniform, but outside the copper was deposited in irregular ridges running at right angles to the lines of force, and apparently coincident with the lines marking the equipotential surfaces. By increasing the power of the electro-magnet, the action is intensified, and the area affected is broadened. The cause of the phenomenon has not yet been elucidated.

PROF. E. LOMMEL describes in *Wied. Ann.* a new polarising apparatus in which two plates of platino-cyanide of magnesium, cut perpendicularly to the optic axis, are used as polariser and analyser, just as in the tourmaline pincette. Such a section of this crystal transmits a blue light, which, when the angle of incidence exceeds 2° , it is found to be perfectly polarised in the plane of incidence, and it therefore can be used, if tilted to that extent out of perpendicularity to the axis, as a polariser for a pencil of parallel blue rays. One curious point in respect to the behavior of thin film thus prepared is the following: Let ordinary non-polarised light be looked at through the crystal while the latter is normal in the line of sight. A white central spot, perfectly circular in form, and non-polarised, is observed in the middle of a blue field, which is polarised at every point radially. The only other crystals which can be used for polarising pincettes are the tourmaline and herapathite (iodo-sulphate of quinine); the point of difference between these and the platino-cyanide of magnesium is that while the two former (which are negative crystals) absorb the ordinary ray, and must therefore be cut parallel to the optic axis, the latter absorbs the extraordinary ray, and must therefore be cut at right angles to the optic axis.

DR. SCOTT'S ELECTRIC HAIR BRUSH.—A good hair brush cannot be bought for much less than the sum for which Dr. Scott's electric brush can be secured. This brush, aside from the curative properties claimed for it, is a well made article, handsome in appearance and first-class in every respect. It is not a metallic brush, but is made of pure bristles. Its electrical qualities are very strong, and will manifest themselves by causing the needle of a magnetic compass to vibrate even with a thick book on the top of a table intervening. Violent vibrations of the needle can be caused by passing the brush quickly back and forth within four or five inches of the compass. It is claimed for this brush that its use will cure headaches and neuralgia, will remove dandruff, and in most cases will prevent the hair from falling or turning gray. In support of this claim many testimonials from responsible persons are adduced. Evidently its use would be of great benefit wherever electricity would prove beneficial, and could not in any event result in harm.—*Boston Journal*, May 28, 1881.

THE FAMOUS "HUB PUNCH."

Handy to have in the House.

HUB PUNCH

Warranted to contain only the best of Liquors, Choice Fruit Juices and Granulated Sugar.

A Delicious Drink with fresh Milk, Ice, Soda or Hot Water, Lemonade or with Fine Ice.

GOOD AT ALL TIMES

AND JUST THE THING FOR USE BY

Families, Hotels, Clubs, Picnic, Camping, Yachting, Excursion, Sleighting and Surprise Parties.

Invaluable for a little treat when a friend drops in.—
N. Y. Evening Post.

Connoisseurs pronounce it Unrivalled.

Messrs. Acker, Merrill & Condit and Park & Tilford, the well-known family grocers and wine merchants of New York, write as follows concerning it:

Messrs. C. H. Graves & Sons, Boston. DEAR SIR: The increased sales of Hub Punch among our always most critical customers is evidence of its superior merit.
ACKER, MERRILL & CONDIT.

Hub Punch is growing in favor among our customers, and we hear many complimentary opinions on its merits. The increasing popularity of the article is pleasant testimony to your success in using exclusively the best and purest components.
PARK & TILFORD.

It is made from the best imported Rum and Brandy, the juice of Lemons, Limes and other fruits, and the finest quality of granulated Sugar.

It is, in short, the perfection of Punches, purer, more delicious, healthful and invigorating than any other article of mixed drink that has ever been devised.

"A sip is like nectar."—*Boston Courier.*

"Delicious beyond description."—*Boston Transcript.*

See that you get the Genuine, and take no Substitute offered.

SOLD BY ALL FIRST-CLASS GROCERS AND WINE MERCHANTS.

COOL
ON ICE.

THE HUB PUNCH.

"Punch and the Holidays are the most intimate friends, going together as naturally as man and wife. But it is a great trouble to make Punch, and many people who like the beverage lack the *savoir-faire* to brew it. Hub Punch is indispensable where ever its merits are known."—*Spirit of the Times, N. Y.*

This is prepared from an original recipe by an adept for his friends, but now given to the world as a standard article.

It is a most convenient addition to family stores, and heads of families, in making up their list of supplies, should not forget to order it of their grocer, druggist or wine merchant. Added to the good things of the table it undeniably enlarges the pleasures of life, and encourages good fellowship and good nature if rightly enjoyed."—*Springfield Republican.*

Our success in selling your Hub Punch has indeed surprised us, we having sold within the past three months a larger quantity than we anticipated selling in twelve. Our large jobbing trade now call freely for it,—both here and in Chicago. We have heard from all sources the highest eulogiums passed upon it.—*Smith & Vanderbeek, New York, Chicago and Paris.*

THE HUB PUNCH is prepared solely by Messrs. C. H. GRAVES & SONS, 35 Hawkins Street, Boston. It is sold in bottles only, is quite as palatable in winter with hot water as it is in summer with cold. The manufacturers guarantee the purity of the liquors of which it is made, as they are of their own importation. Every precaution has been taken against counterfeiting what must inevitably become one of the most popular preparations of Punch among connoisseurs.—*Saturday Evening Gazette.*

CAUTION.—The name and title—"HUB PUNCH"—is adopted as a Trade Mark. All unauthorized use of this Trade Mark will be promptly prosecuted. C. H. GRAVES & SONS, Boston, Mass.

DELICIOUS "HUB PUNCH."

FOR DYSPEPSIA, MENTAL and PHYSICAL EXHAUSTION, NERVOUSNESS, DIMINISHED VITALITY, URINARY DIFFICULTY, etc.

FORMULA :

Each fluid drachm contains

5 1-2 grains free Phosphoric Acid (PO_5)
 3 grains Phosphate of Lime (3 CaO PO_5)
 1-2 grain Phosphate of Magnesia (3 MgO PO_5)
 1-1 grain Phosphate of Iron ($\text{Fe}_2 \text{ O}_3 \text{ PO}_5$)
 1-4 grain Phosphate of Potash (3 KO, PO_5)

Total amount of Phosphoric Acid in one fluid drachm, free and combined, 7 grains.
 It contains no pyro-phosphate, or meta-phosphate of any base whatever.

Prepared according to the directions of Prof. E. N. HORSFORD, of Cambridge, Mass.

There seems to be no difference of opinion in high medical authority of the value of phosphoric acid, and no preparation has ever been offered to the public which seems to so happily meet the general want as this.

It is not nauseous, but agreeable to the taste.

No danger can attend its use.

Its action will harmonize with such stimulants as are necessary to take.

It makes a delicious drink with water and sugar only.

Prices reasonable. Pamphlet giving further particulars mailed free on application to manufacturers.

Physicians desiring to test it will be furnished a bottle free of expense, except express charges, if they mention "SCIENCE."

MANUFACTURED BY THE

RUMFORD CHEMICAL WORKS, PROVIDENCE, R. I.

W. A. HAMMOND, M.D., late Surgeon-General U. S. Army, said that under the use of arsenic and Horsford's Acid Phosphate, a young lady rescued her reasons who had been rendered insane by a dream.

DR. REUBEN A. VANCE, of New York: The preparation on which I place the most reliance is Horsford's Acid Phosphate.

DR. M. H. HENRY, of New York, says: Horsford's Acid Phosphate possesses claims as a beverage beyond anything I know of in the form of medicine, and in nervous diseases I know of no preparation to equal it.

The late WINSLOW LEWIS, M.D., of Boston, said: Having in my own person experienced those ills for which the Acid Phosphate is prescribed, I having found great relief and alleviation by its use, most cheerfully attest my appreciation of its excellence.

The Anglo-Swiss Condensed largest manufacturers of Condensed a superior method of combining the manufacture of a reliable food the medical profession and others in the constituent parts of this prepared on the label of every can.

Persons interested are invited to try this article and compare the results with those obtained from other foods. The advantages offered by the Anglo-Swiss Company are scientific preparation upon a large scale, thus assuring superior quality at a reasonable price. The name is

Milk Co., of Cham, Switzerland, the Milk in the world, having discovered milk and cereal foods, have begun for infants and invalids. In order that interested may know precisely what

ANGLO-SWISS MILK FOOD.

The *Anglo-Swiss* brand of Condensed Milk is also a superior article; 25 millions of cans sold in 1880. Ask your Druggist or Grocer for one of the little pamphlets issued by the Anglo-Swiss Company, telling how Condensed Milk and Milk Food should be prepared for infants. It has saved many lives.

The starchy constituents, ordinarily objectionable in Infants' Food, are changed to Dextrine and Sugar, and rendered soluble and easily digestible by heating Anglo-Swiss Milk Food.
